Minutes: <u>Chairman Klein</u>: opened the hearing on HB 1412. All committee members were

present.

Representative Mary Ekstrom: appeared in favor of HB 1412 and presented testimony. (SEE

ATTACHED TESTIMONY).

John Dwyer, President, Lignite Energy Council: appeared in opposition of HB 1412. I'm not opposed to wind energy, but I think our country needs all forms of energy. Our members are also not opposed to wind energy. About 90% of the electricity market is coal based. And basically is what your suggesting with this bill is there should be another market. Whether it is or is not a mandate, I guess its not an appropriate objective for the state of North Dakota.

<u>Representative Potter:</u> You say you don't think its the right objective, could you explain that? <u>John Dwyer:</u> This bill says the objective is a certain percent in 2010, I guess we think an appropriate objective for the state is they would support all forms of energy. The one that is the most cost effective and the one that is the most reliable.

Page 2 House Government and Veterans Affairs Committee Bill/Resolution Number HB 1412 Hearing Date 2-07-03

Darren Scherr, Energy Program, Department of Commerce: appeared neutral on HB 1412. If you would do totally wind for energy even though the bill doesn't state that, 10% by 2010 would mean over 13 million kilowatt hours per year. I just wanted to let you know what that would be, state facilities was 60 % of the load, 40% the university systems. 77

<u>Representative Winrich:</u> the state buying its power from the grid, as I read the goals listed here doesn't limit the state in any way how it will accomplish that. This is not something that we will say, we will only buy power under these conditions, this may well be a situation where all of the economic bills relating to wind energy that are going thru the legislature also help accomplish this goal. Is that not correct?

Darren Scheir: Yes that is, I would agree with that.

<u>Representative Klein</u>: as time goes on and things come into play we are looking to the future and we don't know what is coming down.

<u>Representative Ekstrom</u>: I would say it is an achievable goal, we are well on our way with that alternative source.

No further testimony provided.

Minutes: <u>Chairman Klein</u>: called the hearing to order on HB 1412. All committee members were present.

<u>Representative Klein</u>; presented an amendment to the committee. How do we know when we are getting wind energy or some other type? Electricity flows the path of least resistance. I find it a real hard bill to try and figure out what is going to happen.

Representative Grande; moved to AMEND HB 1412.

Representative Devlin: SECOND the motion to amend HB 1412

VOTE on amendment to HB 1412. 9-YES 5-NO 0 ABSENT.

<u>Representative Sitte:</u> I don't really see much purpose in passing the amendment. The Legislative Assembly finds and declares there is an essential governmental function and public purpose to encourage wise and orderly development, why not just let it die a natural death.

The micrographic images on this film are accurate reproductions of records delivered to Modern Information Systems for microfilming and were filmed in the regular course of business. Page 2 House Government and Veterans Affairs Committee Bill/Resolution Number HB 1412 Hearing Date 2-13-03

<u>Representative Klein:</u> the only problem with this is the coal people don't want to be left out. This addresses all of the energy possibilities that could happen instead of renewable energy. It makes a statement, saying we think you should look at all possibilities. 1 Part

<u>Representative Kasper:</u> don't forget the horse that brought you here, don't forget the lignite energy industry that has been here for 50 or 60 years that helped develop our state and provide services that we need through there resources, while we are looking at wind, lets not forget lignite.

<u>Representative Grande</u>: having grown up in the center of the oil and gas basin, we don't want to throw that out either, the Williston Basin is huge and its a vital part of our state and we need to utilize all sources and see this as a whole not as a one piece.

Oil and gas is extremely important to the western part of the state.

Representative Winrich: I will resist this amendment, it really doesn't do much, I don't believe

the orginal legislation constitutes a mandate, it talks about setting goals.

<u>Representative Devlin:</u> made a **DO PASS** motion as amended to HB 1412.

Representative Grande: SECOND the motion to do pass as amended to HB 1412.

VOTE: 10-YES 4-NO 0-ABSENT.

Motion carried.

RepresentativeKlein: will carry the bill to the floor.

The micrographic images on this film are accurate reproductions of records delivered to Modern Information Systems for microfilming and Here filmed in the regular course of business. HOUSE AMENDMENTS TO HOUSE BILL NO. 1412 GVA 2-13-03

Page 1, line 1, after "A BILL" replace the remainder of the bill with "for an Act establishing the state's energy policy.

BE IT ENACTED BY THE LEGISLATIVE ASSEMBLY OF NORTH DAKOTA:

SECTION 1. Governmental public purpose - Development of state's natural and renewable energy resources. The legislative assembly finds and declares it is an essential governmental function and public purpose to encourage the wise and orderly development of the state's natural and renewable energy resources. Increased development of the state's abundant lignite coal and oil and gas resources and development of the state's renewable resources, including biomass, hydro, geothermal, solar, and wind, are important components in achieving energy independence for the nation. State energy policies adopted by the state must consider the reliability, cost-effectiveness, enhanced environmental applications, and economic stability and tax revenue benefits to the state from each natural and renewable energy resource. It is a further public purpose not to mandate any state agency, department, or institution to use a particular energy resource."

Renumber accordingly

> STATE CAPITOL 600 EAST BOULEVARD BISMARCK, ND 58505-0360

House Government & Veterans Affairs Committee Chairman Matt Klein February 7, 2003 / Fort Union Room HB 1412 / Renewable Energy Goals

This with

COMMITTEES: Industry, Business and Labor Political Subdivisions

Good morning Mr. Chairman and members of the Government and Veterans Affairs Committee.

My name is Representative Mary Ekstrom. I serve District 11 in Fargo.

I am here to ask for your support for HB 1412 which sets a goal not a mandate for the use of alternative source power (like wind and ethanol) by the State. I have not included any of our higher education facilities in this bill.

I want to tell you a story about the possible future of North Dakota. Imagine the year is 2030. I will be a fine older woman approaching her 80th year - recently retired from the North Dakota House of Representatives.

Seriously, consider that by 2030 North Dakota and the upper Midwest could be the foremost energy producers in North America. The state of North Dakota will providing a full 1/3 of the Nation's electrical energy supply and when combined with South Dakota's potential we will be producing 2.28% of the world's energy needs.

Hydrogen fuel will run our automobiles and electrical generating plants. This source of fuel is non-polluting. To remind you of your chemistry class - when hydrogen is converted to electricity - the exhaust is water vapor.

We will be an attractive place for varieties of businesses. Our agricultural sector, needing clean fuel will see a renaissance as we produce food, pharmaceuticals and products for the biotechnology industry.

It all sounds like a fantasy, doesn't it? Every single aspect of my testimony is borne out by scientific data. Does all the technology work economically right now? No, but all of it is within our sight - within our lifetimes.

Why, then do I want to set a goal for the state that says that 10% of state government's energy needs will come from alternative sources by 2010 and 20% by 2020?

Two words: commitment and vision.

The micrographic images on this film are accurate reproductions of records delivered to Modern Information Systems for microfilming and were filmed in the regular course of business. The photographic process meets standards of the American National Standards Institute (ANSI) for archival microfilm. NOTICE: If the filmed image above is less legible than this Notice, it is due to the quality of the document being filmed.

The states around us are moving much more rapidly than we are in developing this sector. The State by make a commitment can provide one of the early markets for these new fuel sources. We have already made a serious commitment to ethanol use in our state vehicles.

Gathering developers, gathering venture capital, creating the critical mass necessary will help drive the market to solving our transmission problems and develop this industry to its full potential.

I spoke of the future potential for wind power to produce hydrogen as a storable fuel. The future is already here. This is the current issue of the Atlantic Monthly magazine. The ad on the back cover introduces Honda's FCX - a car that run on hydrogen. It is being purchased by the City of Los Angeles as a fleet car.

Please consider an investment in the long term future of North Dakota and give a DO PASS to HB 1412. I have included background data for the committee with my testimony.

Mr. Chairman I will answer any questions you may have.

8

1 think

29 800 8 ⁰

9/24/02, updated 2/1/03

Currently many in North Dakota still consider Lignite Vision 21, the increasing coalfired generation as the leading energy sector opportunity. In the past building coal-fired generation did provide net new wealth for the state; however, wind is the greatest energy resource and if developed holds more economic development promise.

• North Dakota has 2.28% of the world's and 9% of the North American wind resource. Together with South Dakota we have 4.23% of the known world's wind resource and 16% of North Americas.

• North Dakota has the theoretical capacity potential to produce over 34% of the total U.S. electrical generation in year 2000 from wind. More power can be generated from our wind for a longer period of time than any other ND power source.

Harnessing Dakota Wind

- -- Most recent long-term power-purchase agreement was for wind at under 2.2¢ kWh.
- Wind development potential in North Dakota tends to be strongest where our economic strength is weakest; however, over 90% of the state has utility-scale development potential.
 - -- Draw a diagonal line from approximately 30 miles northeast of the northwest corner of the state to approximately 20 miles west of the northeastern corner of the state and, in general our resource is strongest near, on or to the South of that line.
 - -- More communities across the state have an opportunity to directly benefit from wind development than development of any other energy related natural resource.

• Wind power is growing in other states where the resource strength is lower.

If North Dakota had kept pace with national development proportionate to its resource share, it would have over 487 megawatts of installed capacity at the end of 2001. Harnessing Dakota Wind

- In the near future, a federal Renewable Portfolio Standard is likely to be enacted that will include as the enforcement mechanism, the trading of "renewable energy credits" or "RECs." Those power retailers not selling the required incremental amount of renewable energy will have to acquire credits to offset their lack of renewable energy sales. These credits will be purchased from utilities that sold more than the required incremental amount of their electricity from renewable sources. The REC exchange markets will provide an entirely new revenue stream to utilities in high growth consumption areas capable of accessing credits for sale. This will push higher demand from renewable generators capable of high volume production. North Dakota wind is abundant and adjacent to high consumption states to the east. It is also the lowest cost of any renewable generation other than old hydroelectric production. Thus, demand for North Dakota wind production will accelerate with a national renewable credit trading exchange.
- In the near to mid-term future, it is likely that the United States will join most of the developed world in carbon dioxide emission credit trading. Like RECs, a cap on overall carbon emissions would be placed and use tradable credits as an enforcement mechanism. Either the generator or the retailer of carbon emitting power will have to purchase carbon offsetting credits from either the generators or retailers of low or no-emission power. Those states with strong wind development will benefit from either increased demand for their product or enhanced revenue from the direct sale of credits. Again, North Dakota's wind resource places us in the

Harnessing Dakota Wind

best position to benefit from such trades.

- Wind power development is very compatible with our agricultural sector. A rule of thumb is that 1.5 megawatt turbines must be spaced one to a quarter section in order that they stay out of the wind shadow of each other. However, each turbine takes less than two acres out of production.
- By 2005 every major automobile manufacturer will have a hydrogen fuel cell vehicle in the showroom. The City of Los Angeles is taking delivery on Honda's fifth generation hydrogen fuel cell vehicle in early 2003. Honda's hydrogen fuel cell vehicle has a top speed of approximately 100 miles per hour, accelerates 0 - 60 in just over 9 seconds and has a range of 220 miles. Hydrogen is efficiently produced by shooting electricity through an electrolyzer separating water into its two components, hydrogen and oxygen. Hydrogen production is very compatible with wind in that we can build a wind system (geographically dispersed array of windfarms connected to a central long-haul transmission line) that allows peaking winds to produce hydrogen in such a way as to firm the electricity flowing to the transmission grid. The hydrogen is piped to the Minneapolis metro area for use as a vehicular fuel while electricity is transmitted to Minneapolis and Chicago markets. In essence, an 8,000 MW transmission line can be paired with 12,000 MW of wind turbine capacity and a hydrogen pipeline. When the wind system is overproducing, the electricity is diverted to hydrogen production/storage and as the wind system production tapers a greater number of turbines are available to fill the transmission line. Generally greater demand for hydrogen could increase demand for the electricity to produce hydrogen.

Impediments:

- No development goal and a lack of commitment to develop as aggressively as other states.
 - -- lack of focus with regard to policy development planning.
 - -- fragmented stakeholder community.
 - -- no coordinated vision or effort in overcoming impediments.
 - -- discourages developers.
- Lack of export transmission capacity.
- Fragmented transmission planning without broad stakeholder involvement.
 - -- no common definition of capacity objectives.
 - -- conflicting interests not addressed.
 - -- suspicion among various stakeholders as to what is being planned.
 - -- lack of "what is possible" vision.
 - -- no clear message for federal regulatory or legislative direction in meeting our transmission requirements.

Other impediments are secondary and more easily resolved. It is leadership and the will to focus on where North Dakota should be in wind development 20 years from now.

At Stake:

We have one of the world's finest wind resources and if we developed our resource proportionate to its value and the Department of Energy initiative of having 5% of U.S. electricity derived from wind by 2020, here is some of what we gain based on a study by Dr. Leistritz, Economist, North Dakota State University:

Is there a greater rural economic development plan on the horizon? Can we afford to allow this huge opportunity to blow by?

The chart below shows the state shares of the national wind resource as compared to share of national development each state has experienced. As can be seen, Texas, Minnesota, Iowa, New York, California and Wisconsin are all overdeveloping relative to their resource share. North Dakota and South Dakota have the lowest level of development relative to resource shares. It is not a question of <u>if</u> wind will become a major power source but one of where. The leadership we enjoy in resource is lacking in development. What we don't develop, others clearly will. If lost opportunities are costs....this one is expensive.
