

## Red River Valley Water Supply Project

## Garrison Diversion Mission

"Provide a reliable, high quality, affordable water supply for the benefit of North Dakota"

## Red River Valley Water Supply Project

Authorized by the  
Dakota Water  
Resources Act

Mandated an EIS with joint leadership  
between the federal government and  
the State of North Dakota.

\*MR&I \*Streamflow Augmentation \*Groundwater Recharge

## Current Status of Project

### Final Needs & Options Report –

Released November 2005

### Draft EIS –

Released December 2005

### Supplemental Draft EIS –

Released January 31, 2007

### Final EIS –

Released Fall 2007 (anticipated)

## The Region

### 13 eastern North Dakota counties

### 3 Minnesota cities:

- East Grand Forks
- Moorhead
- Breckenridge

## Facts about the Region

### Population

- 42.4 % of North Dakota's population resides in the Red River Valley
- Current Red River Valley population – 315,522
- Predicted 2050 population – 479,252

### Tax Revenue

- 52% of ND sales & use tax collections are derived from the 13 Red River Valley counties (Source: 2004 North Dakota Sales and Use Tax Statistical Report)

## Industrial Water Use

Studies show if a water supply shortage is greater than 15% industries will leave the area.

### Project Area – Existing Water Supplies

## Facts about the Region

Drought frequency and climatic study research concludes that a drought such as the one that occurred in the 1930s is likely to happen again before 2050.

## The Problem

If a 1930s type drought hit the Red River Valley today, with current water demands, the Red River Valley would be short water every year, with a worst monthly shortage of 46%.

## The Impact - If We Do Nothing

### Consequences of No Action

- 55,000 ac-ft shortage (41%)
- \$20.7 billion impact of a 10-year 1930s-type drought
- Lake Ashtabula does not maintain 28,000 ac-ft Fish & Wildlife Conservation Pool
- Extreme low flows in Sheyenne & Red Rivers
- Invasive species threat continues
  - Great Lakes shipping
  - Numerous existing pathways

## 3 Pronged Solution

## Potential Water Supplies

- Needs & Options Report studied:
  - Minnesota groundwater
  - Lake of the Woods
  - Red Lake River
  - North Dakota groundwater
  - Devils Lake
  - Missouri River

## GDU Import to Sheyenne River

Would link the GDU Principal Supply Works to the Sheyenne River via a buried pipeline to meet shortages.

**Cost: \$659.4 million**

## Boundary Waters Treaty Compliance

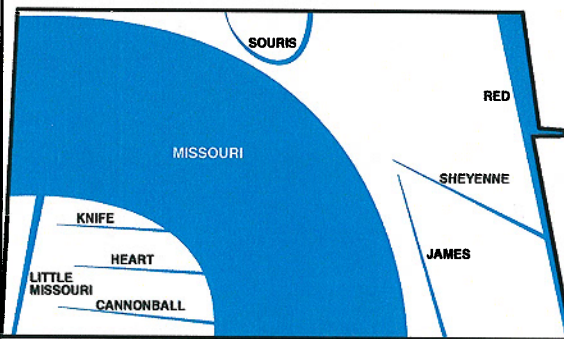

- Canada's recommendation
  - Media filtration
  - Ultraviolet disinfection
  - Chlorination and/or Chloramine Disinfection
- Proposed biota water treatment plant meets these goals

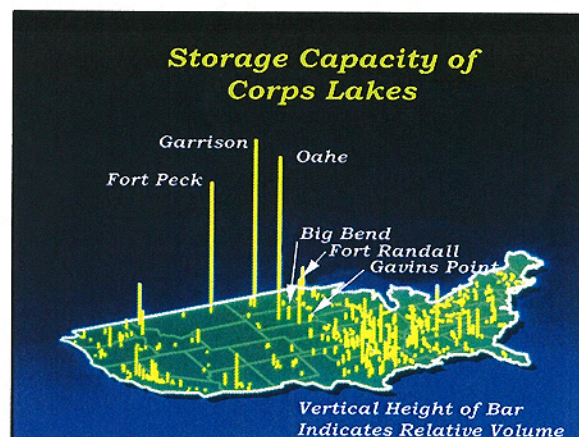

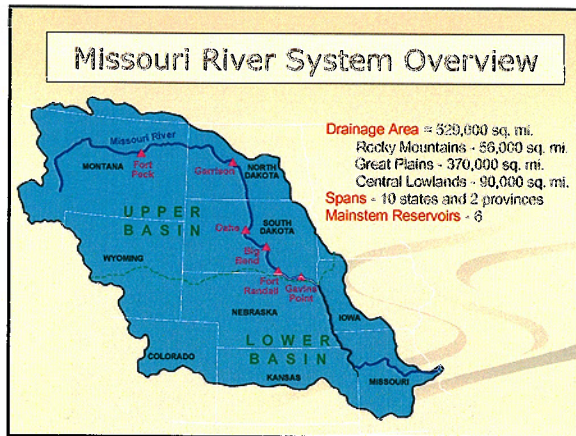

## Boundary Waters Treaty Compliance

Manitoba Water Stewardship Biota Water Treatment Goals		
Parameter	Treated Water Goals for Biota Prior to Inter-basin Transfer	Comments
Turbidity	<0.3 NTU	This is necessary to ensure effectiveness of disinfection against viruses.
Disinfection-resistant Protozoa such as <i>Myxobolus cerebralis</i>	2.5 log (99.5%) removal	This should be achieved in a minimum of two separate barriers including filtration followed by ultraviolet (UV) disinfection.
Other Protozoa with similar characteristics as <i>Giardia</i> and <i>Cryptosporidium</i>	4 log (99.99%) total removal/inactivation with a minimum of 2.5 log by removal	This should be achieved in three separate barriers with disinfection achieved by UV and chlorination or ozonation.
Viruses	4 log (99.99%) inactivation	This can be achieved through disinfection.

## Average Discharge of Principal Rivers in North Dakota

## RRVWSP Water Use: A North Dakota Perspective

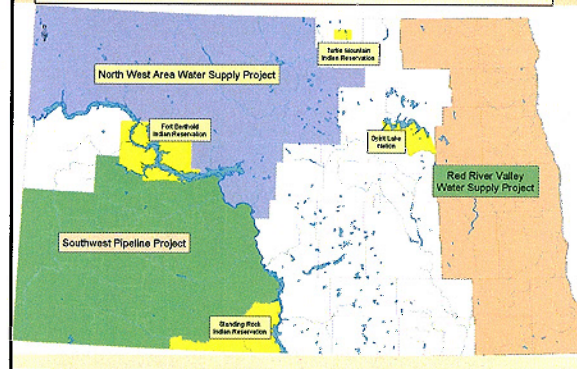

Average annual Missouri River flows available  
at Bismarck = 16,700,000 ac-ft

Less RRVWSP	80,000 ac-ft
NAWS	15,000 ac-ft
SWPP	6,800 ac-ft

Missouri River flows unused = 16,598,200 ac-ft

Leaves 99.67% in system for other water uses

## ND Regional Water Systems

## Next Steps

Fall 2007 – EIS complete

**Record of Decision** (anticipated)

2010 – Three years to construct

**Start of construction** (best case)

## Red River ~ 1910
