

I am writing in support of the resolution to study the causes and potential treatments of metabolic disease. Obesity and associated metabolic diseases increases the risk of type 2 diabetes and all its sequelae, including heart disease, kidney disease, stroke and cancer. Newer dietary strategies, such as intermittent fasting have the potential to significantly reduce the burden of disease at little or no cost, and should therefore be studied.

Dr. Jason Fung, Nephrologist, author, The Obesity Code, The Diabetes Code
